Jeppe Update — 2026-08-04

Overview of Time Spent

- Mostly compression study
- Some `qim3d` work
  - Would like to do a bit of a sprint before many new people start, but need Felipe/Jakob
- Not insignificant time wrangling HPC
  - Despite HPC TA, need better ways of interacting with HPC
  - Some time spent on prototype tool `ezhpcy`
  - Some time spent on `dask-jobqueue` setup

Qim3D

- Mostly little fixes for bugs I found when using `qim3d` for compression study
- No/little movement on DX improvements
  - Strategy? Approach Felipe, abandon, wait?
- Top priority:
  - `pre-commit`/formatting currently creates a lot of friction
  - tests *need* to be run in CI
    - 46 fail, 180 pass
    - Currently this creates a lot of extra work during review

Compression Study — Overview

- WIP: Report (can demo)
- Have gotten very nice structure set up for reproducible experiments
  - Care has gone into eliminating IO
    - We leverage `/dev/shm` as RAM-disk
    - Some variability tests
  - Ensuring consistent HPC environment
  - …
- Gotten overview of most relevant compression methods/codecs
- Some confusion about project scope after talking with Felipe?
  - Is TIFF hard requirement?
  - File sizes?

Compression Study — Preliminary Literature Review

- Mostly medical imaging, relatively few with projection data, mostly just reconstructions
- [1], [2]
  - $\min(\mathrm{SSIM}_{\mathrm{local}}) < 0.99$ indistinguishable by radiologists
  - Lossless has best-case compression ratios $\approx 1.70 : 1$ (JPEG-LS) to $\approx 1.95 : 1$ (proprietary from paper)
  - Lossy compression about $3 : 1$ while indistinguishable for radiologists (we can do better?)
- Some reading up on `imagecodecs` and `zarr`

Compression Study — Preliminary Findings

- JPEG-XL seems very promising
  - Recently DICOM standard [3]
  - Best-in-class for lossless
  - Works for `u8`, `u16`, `f16`, `f32`
- LERC promising because guaranteed error bounds
  - Can propagate under linear assumptions?
  - Works for just about any data type

Compression Study — Codec Overview (WIP)

Encoding	Pixel Types	Channels	Type	Categories	Unsuitable Reason
JPEG 1 (lossy)	**u8**, **u12** (mono)	**1/3**	L	DICOM, TIFF?	Bit-Depth
JPEG 1 (lossless)	**u1-16**	**1/3**	LL	DICOM, TIFF?	Bit-Depth?
Run Length Encoding (RLE, DICOM)	**u1/8/16**, u1-64	**1/3**	LL	DICOM, TIFF	
JPEG-LS	**u2-16**, u2-32	**1/3**	L, LL	DICOM	
JPEG 2000	**u1-38**	**1/3**, ≤ 16384	L, LL	DICOM, TIFF?	
JPEG 2000 (HTJ2K)	**u1-38**	**1/3**, ≤ 16384	L, LL	DICOM	
JPEG-XL	**u1-24**, u1-32	**1/3**, ≤ 4099	L, LL	DICOM, TIFF?	
WEBP	u8	3/4	L, LL	DICOM, TIFF?	Bit-Depth
AVIF	u8/10/12	$\leq 2^{32}+1$	L, LL		Bit-Depth
LERC	i/u8/16/32, f32/64	$\leq 2^{31}-1$	L, LL	TIFF?	
Blosc	sd				
Zstd			ddd		
LZW	Any	N/A	LL	TIFF	
ZFP					
SZ3	(i/u8/16/32/64), f32/64		L, (LL)		
CCITT Group 3 (G3)	u1	N/A	LL	TIFF	Bit-Depth
CCITT Group 4 (G4)	u1	N/A	LL	TIFF	Bit-Depth
SGILOG	u8/16, f32	1/3	LL		

Table 1: **Bold** refers to configurations supported by the DICOM specification. *TIFF?* refers to codecs that have been granted a TIFF compression tag, but are not widely supported by TIFF readers, whereas *TIFF* refers to codecs that are widely supported by TIFF readers. Note that TIFF is a container format and can contain codecs that have not been granted a TIFF compression tag. If the *Unsuitable Reason* column is not empty, the codec has been deemed unsuitable for inclusion in this study on the basis of the reason provided.

Compression Study — Experiments

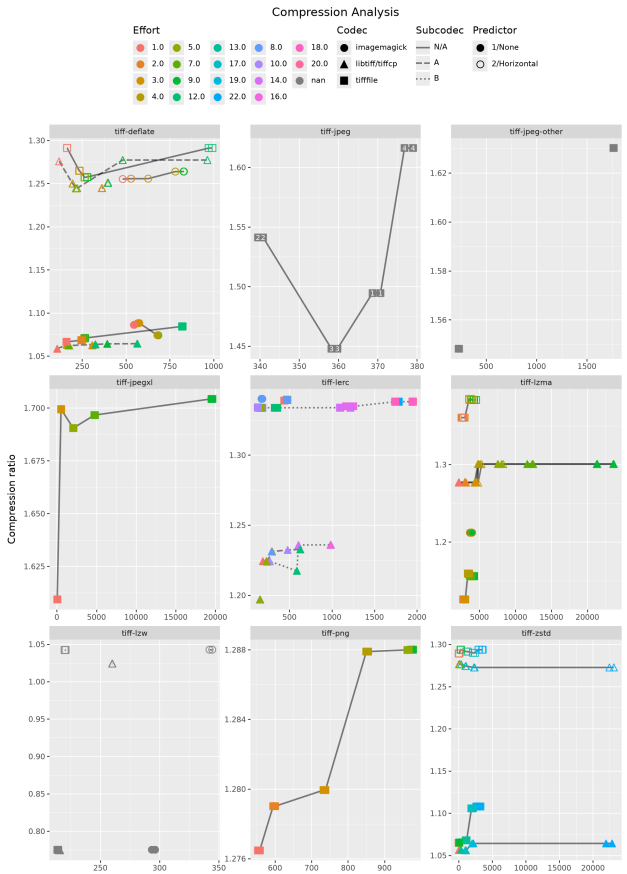

- Main experiments:
  - WIP: Lossless, tiff-stack, projections compression
  - WIP: Lossless, zarr, projections compression
  - WIP: Lossy, tiff-stack, reconstructions compression
  - WIP: Lossy, zarr, reconstructions compression
  - (lossy reconstructions -> projections study)
- Smaller experiments:
  - Mostly done: Variability in encoding/decoding speeds
  - WIP/Not started: File size scaling
    - WIP: zarr chunking initial study

Note: Some Zarr stuff, though not shown here.

- I much prefer Zarr to TIFF!

Compression Study — Lossless TIFF Stack Compression

- WIP and made for report, so quite tiny
- JPEG-XL seems best
  - 1.7 CR => 40% space savings (for free!)
  - Very new format, still improvements to be made
    - Found some critical bugs bugs, hopefully fixed in `0.13` (September?)
    - Will improve: adopted in PDF and DICOM standards
- JPEG-LS also good
- LERC somewhat lack-luster, unfortunately
- Standard bytestream codecs (zstd, lzma, deflate, lzw) are pretty bad

Compression Study — Lossy JPEG-XL TIFF Reconstruction Compression

- Distance $d = 0.1$, `f32` data ($1000 \times 1000 \times 1000$ shape):
  - 99.55% of pixels have SSIM > 0.99
  - Compression ratio of 12.9 (92.2% space savings!)
- Hopefully ran lower distance tests over night, not sure if finished
- Pretty comparison picture missing :(

Other

- Think I got hours sorted (now 15/week)
- TODO: Reimburse conference ticket
- Anything I should do before conference?
  - Would have been great to have compression study done, but *alas*
- LLM subscription?
- QIM Platform?

Show Code

- Maybe quickly show code any over-all structure
