Outline

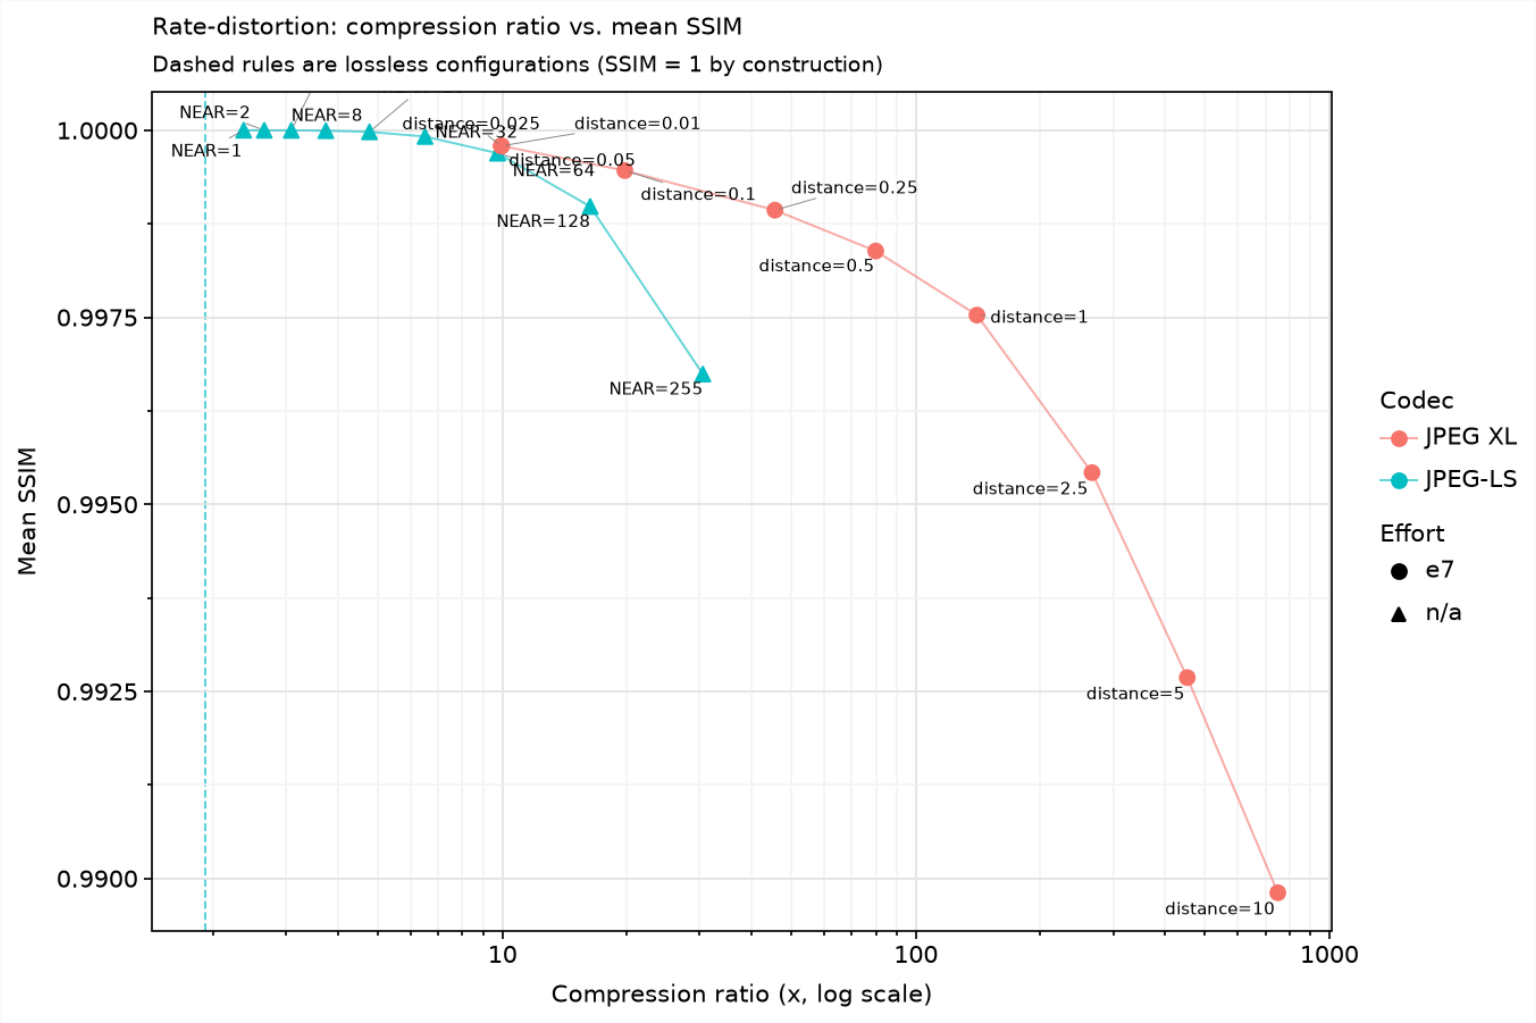

Dataset in Proposed Formats . . . 3
Codec Performance — Fidelity . . . 4
Codec Performance — Throughput . . . 5
Software Support . . . 6
OME-Zarr tooling . . . 7
Summary of options . . . 8
Follow-up: JPEG-XL across compression axis . . . 9
End of slides . . . 10
Format Support . . . 11
Size Considerations . . . 12
Size Consideration Table . . . 13

Dataset in Proposed Formats

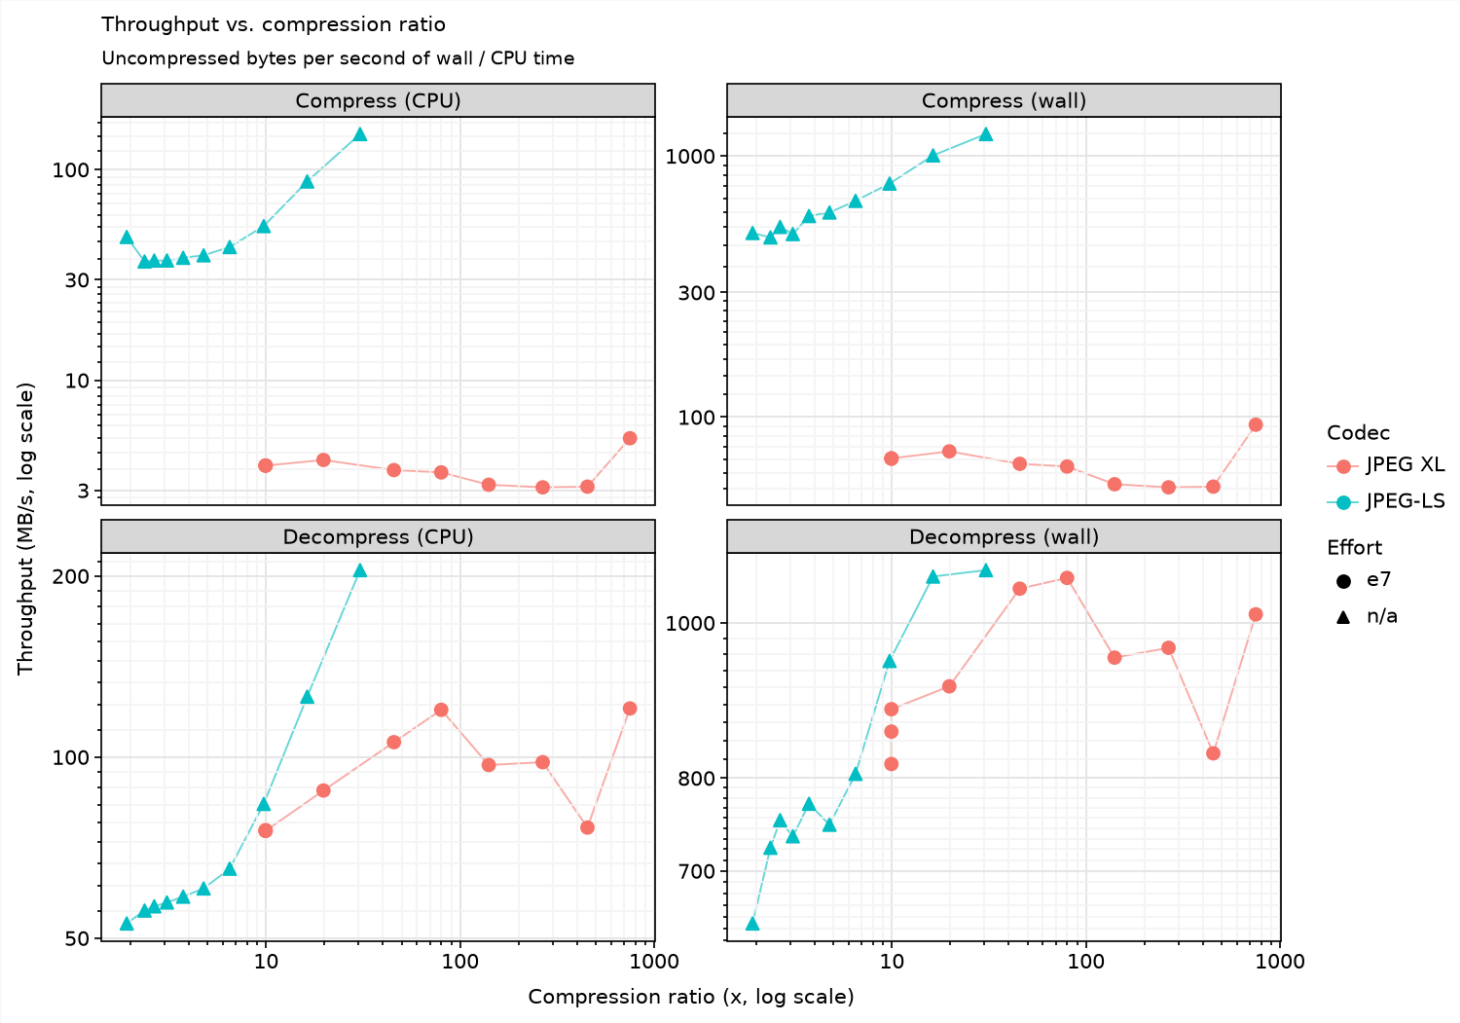

- Agreed last time: make a dataset available in following formats:
  - DICOM
    - No compression
    - JPEG LS
    - ~~JPEG XL~~ *no JPEG XL support in* `pydicom` *yet*
  - OME-Zarr (multi-resolution)
    - No compression
    - JPEG LS
    - JPEG XL
  - Available (for now) here[1]
    - Not sure how to share data in a good way, would like advice

Codec Performance — Fidelity

Codec Performance — Throughput

Software Support

- DICOMs appear to work in *Napari*, *3D Slicer*, *Fiji* for me
  - No access to other software packages; would be good to test these
- OME-Zarr:
  - Documented in `usage/<VIEWER>` folders in the shared data repository
  - Napari: Works `napari-ome-zarr` plugin, (caveat: compression requires a little trick, for now)
  - Fiji: Works with built-in `BigDataViewer` plugin (maybe still spotty support for codecs)
  - 3D Slicer: Workable by using Python intepreter, see `usage/3D_Slicer`.
  - Likely no support in proprietary software packages, but worth checking

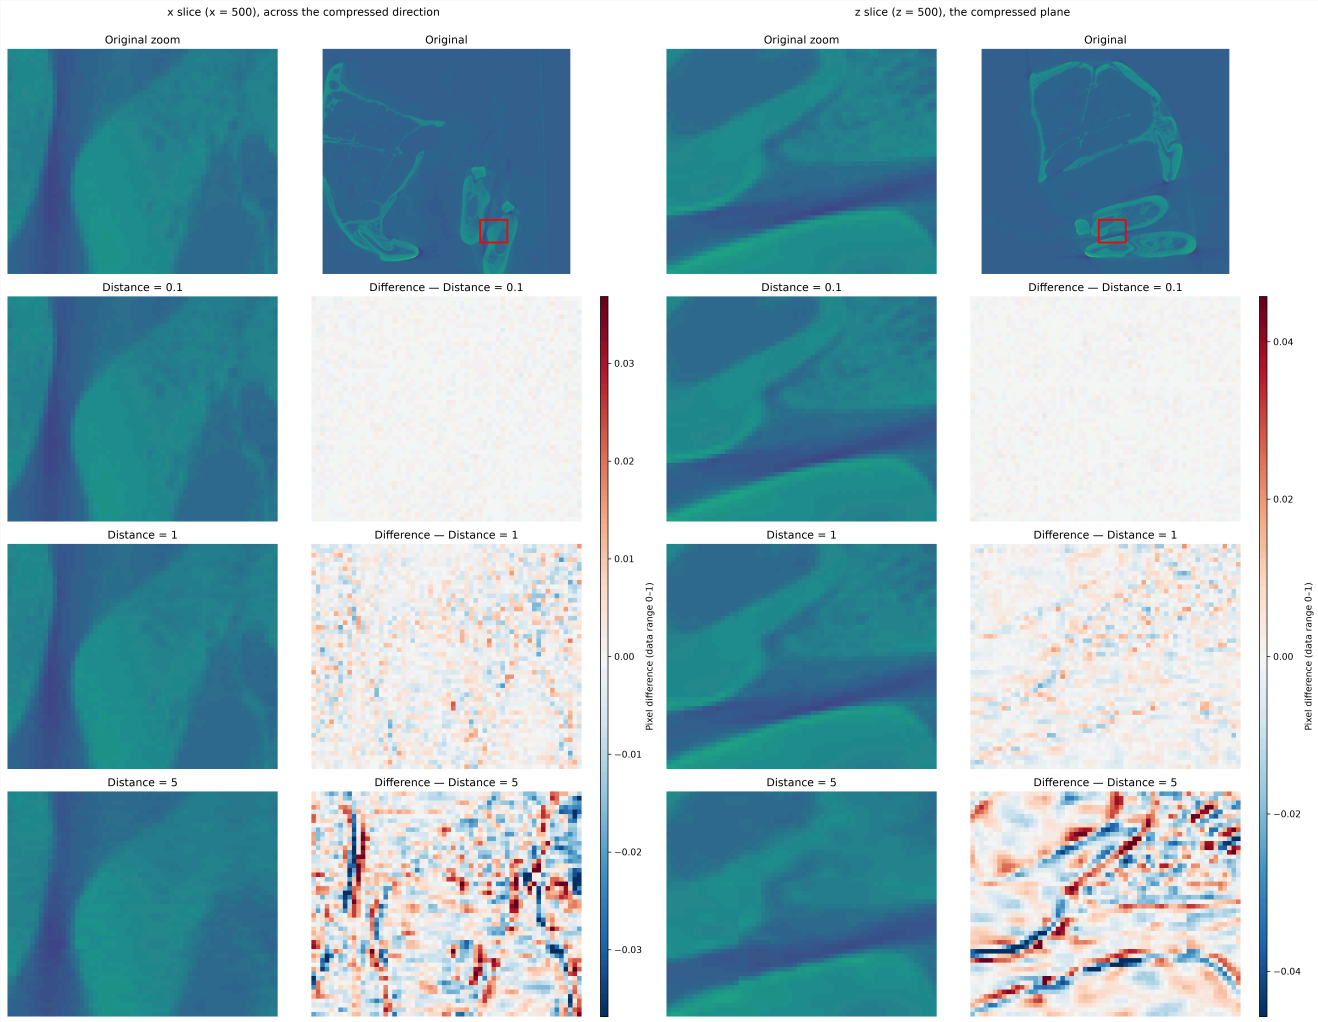

OME-Zarr tooling

- `ome-zarr-py` by the OME (Open Microscopy Environment) organisation is maintained and actively developed
- Possibly open to addition of conversion tool
- Already support for the web-based file serving suggested in earlier meeting
- Thus can serve OME-Zarr datasets directly from object storage (e.g. Backblaze B2 or self-hosted) without downloading the entire dataset first
- Combined with proposed conversion feature: very nice workflow for downloading data, even if locally TIFF stack is required

Summary of options

1. Older, non-lossy-compressed format (TIFF)
2. DICOM with lossy compression (JPEG-LS or JPEG-XL)
3. OME-Zarr with lossy compression (JPEG-LS or JPEG-XL)
   - Combined with easy-to-use tool that can download and convert to TIFF stack locally
   - This also supports multi-resolution, so researcher can download downsampled dataset only
4. ???

Follow-up: JPEG-XL across compression axis

End of slides

Slides that follow this are from previous meetings and are here just for reference.

Format Support

Format	ImageJ/Fiji	Napari	VGSTUDIO	Amira/Avizo	3DSlicer	Dragonfly	Checkpoint	Morphosource	Data Types	Comment
BioFormats	Yes[1]	Yes[1]	No	Yes	No	No	No	No

[1] With plugin
[2] Supported through `.czi` format
[3] With plugin by Janelia
[4] Does support HDF4

Size Considerations

- Detectors:
  - Large samples: Spectrumlogic, 5606×4800 px, pixel size $50\,\mu\text{m}$
  - Smaller samples: Varex, 3072×3072 px, pixel size $139\,\mu\text{m}$
- *Optimistic* canonical volume: 3072^3 vx $= 28.9$ Gvx (assuming 16-bit)
- Assume 50% (?) crop as an average: 14.4 Gvx
  - 16-bit: $28.8\,\text{GB}$ uncompressed

Cloud storage cost: Backblaze B2 Object Storage[1]:

- Includes 300% monthly egress (data can be downloaded 3 times per month for before additional fees)
- Price is for 5 years of redundant, 'active archive' storage
- 83 USD / TB / year $\Rightarrow$ 0.415 USD / GB $(2.65$ DKK$)$
  - Significantly cheaper than MorphoSource, though this is only for 5 years

Size Consideration Table

- Cell rows: data size, storage cost (MorphSource), storage cost (Cambridge RCS/RFS), storage cost (Backblaze B2)
- Cell columns: 1 recon., 1 week of recons. (shaded, 500), 1 year of recons. (26089)
- Units have been SI-ified: mkr = milli-kroner, Mkr = mega-kroner/million, etc.
